The sitemap was shaped around what came up in the interview about grocery shopping. The design focuses on making it easier for families to build and manage lists together, while avoiding common frustrations like forgetting items or buying duplicates. Because the user mentioned wanting a real-time inventory system, the plan includes integrations with online stores so people can check if an item is in stock before heading out. Collaboration was also a key point, especially between spouses, so features for sharing and syncing lists were made central. To cover ongoing household needs, the design also assumes there should be a way to set up automatic orders for essentials like rice. The layout follows a natural flow such as which routes a user could go when using the platform, starting with creating a list, adding and assigning items, syncing across devices, and finally connecting with stores to make shopping smoother.
